

BIOCHAR ACTIVE

using on trees

STEP 1

EXISTING TREES:

Apply a surface dusting of 300 grams (1 litre) per square metre in the soil under the canopy, ideally under any mulch layer.

NEW TREES:

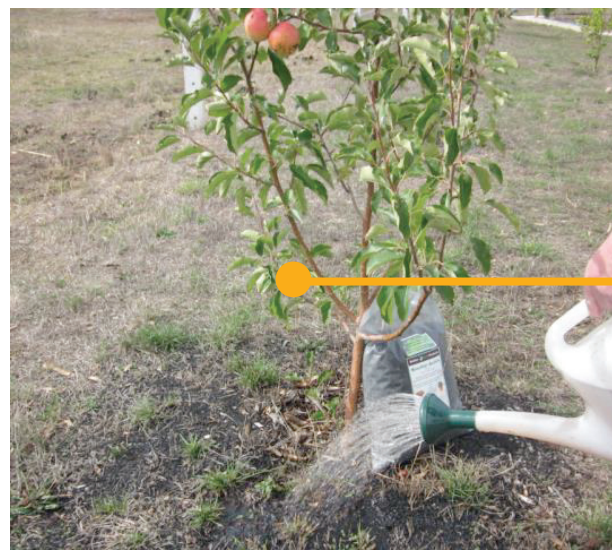

When planting apply Biochar Active generously into the hole, for example 1-2 litres per small tree during transplanting

STEP 2

Sprinkle evenly the Biochar Active over the tree canopy area being conditioned

STEP 3

Water in well. According to soil condition and drought circumstances reapply every 4-8 weeks when flowering or fruiting and every 8-16 weeks otherwise. According to soil and plant condition reduce application rate each year by increasing the time between applications.
